Improving Transition from NICU to Home for Infants Requiring Complex Care

Executive Summary

In recent years, increasing numbers of children with special health care needs go home from the neonatal intensive care unit (NICU) requiring some form of supportive technology. For newborns, the main types of technological support needed are nutritional support and respiratory support. The decision to discharge home is made primarily on the basis of the infant's medical status but is complicated by several factors, including family readiness for discharge, differing opinions about what forms of care can be provided at home, and pressures related to hospital costs and length of stay. It takes time for the family of a high-risk infant to prepare to care for their infant at home and to secure the necessary support services and community resources.

Infants often go home from the NICU requiring more care and closer follow-up than was typical in the past. For technology-dependent infants, particularly those requiring tracheostomy and a ventilator, the time to discharge can be significantly delayed by months to even years. Barriers to discharge may include difficulty in finding home nursing, inability to obtain timely funding for home care, and lack of a suitable home environment. Best practices to help families and young children in the transition from the hospital NICU to home include optimizing caregiver involvement in an infant's care early on in the hospital stay, shared decision making between medical providers and families, and a standardized team-based approach to prepare the home environment for a technology-dependent child. An appropriate discharge plan needs to be developed throughout, rather than at the conclusion, of the hospital stay in order to successfully identify community resources and prepare a clear path to transition home. Ideally, all of these plans will include input from and collaboration between parents/caregivers, care managers, and the NICU team, however there may be a disconnect between these stakeholders in this process. As more NICU babies with complex medical needs are discharged to home, recent studies have shown that readmission rates of premature infants are on the rise, leading to further increases in healthcare expenditures.

---

Improving Transition from NICU to Home for Infants Requiring Complex Care

Executive Summary

The Ohio Perinatal Quality Collaborative (OPQC) network has successfully implemented several quality improvement projects focused on improving prenatal and perinatal outcomes for women and children in the state of Ohio. In collaboration with the Ohio Department of Medicaid (ODM), OPQC began the NICU Graduates Project in July 2015 with the purpose of using quality improvement methods to improve care for infants with complex healthcare needs in the transition from a neonatal intensive care unit to home. A six month design phase included interviews with families/caregivers, clinical experts, and organizational stakeholders to learn what ideal care and transition home would look like in this population, and to help inform our key driver framework and change theory. Our goal was to work with NICU teams to develop better practices and standardization in the transition to home process which may ultimately lead to improved care coordination and reduced discharge delays. Overall, this project aimed to reduce avoidable unplanned readmissions and decrease length of stay for infants with tracheostomy with or without ventilator, and/or gastrostomy tube, as measured below:

**AIM:** Infants with complex needs will have optimal care and outcomes as a result of improved and sustained support for families during and after NICU stays, resulting in being successfully cared for at home. The teams worked to successfully transition NICU infants to care at home, as measured by:

- Decreased average time from initiation of medical intervention (trach/vent/g-tube) to care at home by 10%
- Decreased time from “physiologically ready for discharge”* to care at home
- Decreased time from “medically ready for discharge”** to care at home
- Decreased avoidable unplanned readmissions within 7 days of discharge by 10%

In order to achieve the aim, the project focused on the following key drivers:

- Early identification of need for medical intervention
- Strengthened family capacity to care for infant during transition to home and long term
- Earliest and standardized process for transition to home
- Enhanced coordination of care through a prepared medical home and needed community resources
- Available and adequately trained home nursing workforce
- Collaboration among families, clinicians, hospitals and insurers to identify & address system barriers

*For the purposes of this project, “physiologically ready for discharge” was defined as, at a minimum, an infant is: 1) Tolerating feeding regimen suitable for home; 2) Successfully transitioned to home ventilator on stable settings (if applicable); 3) Utilizing supplemental oxygen flow suitable for home; and 4) Off intravenous medications. Medically ready for discharge is defined as an infant being “physiologically ready” and when caregiver education is complete.
The following key driver diagram is the model used by NICU Graduates teams to develop and test process improvement work for improving the transition home for NICU infants with complex needs and technology dependence. The key drivers are the factors that contribute to achieving the aim. The interventions are change concepts that impact the key drivers.

**SMART Aim**

By June 30, 2018, NICU infants with complex needs will successfully transition to care at home, as measured by:

- Decreased average time from initiation of medical intervention (trach/vent/g-tube) to care at home by 10%
- Decreased time from “medically ready for discharge” to care at home by X% (hospital and system sensitive)
- Decreased time from “physiologically ready for discharge” to care at home by X% (system sensitive)
- Decreased avoidable unplanned readmissions within 7 days of discharge by 10%
- Family/parent/caregiver measures TBD

**Global Aim**

Infants with complex needs will have optimal care and outcomes as a result of improved and sustained support for families during and after NICU stays, resulting in being successfully cared for at home.

**Key Drivers**

- Early identification of need for medical intervention (trach, vent, g-tube)
- Strengthened family capacity to care for infant during transition to home and long term
- Earliest and standardized process for transition to home
- Enhanced coordination of care through a prepared medical home and needed community resources
- Available and adequately trained home nursing workforce
- Collaboration among families, clinicians, hospitals and insurers to identify & address system barriers

**Interventions**

- **Optimize decision to trach, including family readiness and infant’s medical readiness**
  - Utilize shared decision making tools
- **Caregiver education during hospitalization**
  - Early, repeated education based on learning style assessment
  - Use of simulation technology, teach-back method, journey board
  - Provision of red flag action plan
- **Assessment of family’s emotional needs**
- **Develop and activate peer social support and parent community**
- **Continuous support from sub-specialty team after transition to home**
  - Plan for and utilize technology to connect families and providers after transition to home, consider e-mail and telemedicine
- **Identify and communicate with Medicaid/payer Care Manager/Case Manager**
- **Standardize roles and responsibilities of discharge point person at Children’s hospital and Medicaid/payer, and include family in communication**
- **Enhanced understanding of public resources**
  - Create tools to guide appropriate resource utilization (DME, home nursing, community support, etc.)
- **Identify eligibility for available resources (Managed Care Medicaid/payer, Waiver) and early triggers for application process**
- **Work with Medicaid/payer to ensure qualified home nursing**
  - Develop guidelines for home nursing care with individualized patient red flags
- **Create and standardize assessment/reassessment tools to match home nursing services to the child’s needs**
- **Ensure seamless provision of Durable Medical Equipment and other emergency equipment**
  - Standardize checklists for DME with best practices
  - Establish early contact with DME providers
- **Standardize hand off between Children’s Hospital and PCP, with standard communication including:**
  - Phone call prior to transition home with entire team including current provider (pulmonologist/neonatologist), family caregivers/parents, and PCP
  - Discharge notes and red flag action plan provided to PCP in timely manner
How to Use This Change Package

A change package is a concise document that includes ideas and inspiration for teams seeking to apply quality improvement methods to increase the effectiveness and efficiency of their care processes and outcomes. Change packages focus on a specific condition, care process, or health system feature and generally include background material; a summary of evidence or best practices; and specific tools, strategies, and examples that can be applied to improvement work.

This change package outlines strategies for NICUs as they begin to improve the transition from NICU to home in a collaborative effort that include parents, caregivers, families, clinicians and insurers. Included in the following pages are resources and tools to improve transition home using the key drivers employed in the NICU Graduates Project to assure that infants with complex needs will have a successful discharge process and care at home.

Forming Your Team and Understanding Your System

Forming a project team is the first step in beginning your improvement work. The following roles are suggestions for a NICU Graduates Project site team. This list is not exhaustive, and there may be other roles at your site involved in transition planning. You should feel free to include as many people and roles as you feel are necessary to your team. In addition, you may consider including other stakeholders, external to your site, who can contribute to your improvement work (e.g., DME, home nursing provider, payer).

<table>
<thead>
<tr>
<th>Role</th>
<th>Responsibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neonatologist</td>
<td>A physician with experience caring for infants in the NICU, with specific involvement during transition to home. This person can also be the lead MD.</td>
</tr>
<tr>
<td>Pulmonologist</td>
<td>A physician with experience caring for infants with tracheostomy (with and without vent) and/or chronic complex pulmonary conditions. This person can also be the lead MD.</td>
</tr>
<tr>
<td>Nurse</td>
<td>A NICU nurse who is part of the care team, preferably has experience with transition to home, and can work to be an advocate for the NICU Grads Project within their site.</td>
</tr>
<tr>
<td>Care Manager</td>
<td>A team member who provides care coordination in the NICU for babies with complex needs.</td>
</tr>
<tr>
<td>Family Representative</td>
<td>A parent with experience with the site NICU and has had a baby with a tracheostomy (with or without a vent) and/or a g-tube.</td>
</tr>
<tr>
<td>Social Worker</td>
<td>This team member serves as a key leader in planning for transition to home and brings knowledge of available community resources to support the family in recovery.</td>
</tr>
<tr>
<td>Family Liaison</td>
<td>A hospital employee who connects with families on a regular basis. This person could also serve in another clinical role on your team.</td>
</tr>
</tbody>

Improving Transition from NICU to Home for Infants Requiring Complex Care

How to Use This Change Package

Once your team is formed, it is useful to start by understanding the characteristics of your practice that support transition from NICU to home for infants with complex needs. It is recommended that your entire project team complete a Systems Inventory together, such as the one below. The Systems Inventory is informed by the key drivers and change strategies in the Key Driver Diagram. Ideally each team member should take the inventory and then discuss the findings as a group. Did everyone have the same responses? It is helpful to come to consensus on your current practice first before moving onto the next step.

NICU Graduates Systems Inventory Tool

Instructions: For each of the following statements, indicate the response (yes, no, in process) that most accurately reflects your NICU’s current state. Once you have completed each section, identify and prioritize potential areas of focus for your improvement work.

Section 1: Early identification of need for medical intervention

<table>
<thead>
<tr>
<th>Statement</th>
<th>Yes</th>
<th>No</th>
<th>In the process of implementing</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Does your team have a process to support family readiness for decision to trach?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2) Does your team have a process to support family readiness for decision to g-tube?</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Section 2: Strengthened family capacity for care through transition to home preparation

<table>
<thead>
<tr>
<th>Statement</th>
<th>Yes</th>

<td>Our families are assigned one care coordinator/point person throughout their stay</td>
<td></td>
<td></td>
</tr>
<tr>
<td>24)</td>
<td>Family care coordinators continue to provide support to families after their transition home</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Mapping Your Transition to Home Process

A process map, or flow chart, is a diagram that shows each step in a process that a team wants to understand. The beginning and end points of the process are depicted by ovals; actions are described in rectangles connected by arrows pointing in the direction that the process should flow. When there are options to choose from, a diamond-shaped box indicates a decision step for which a “yes” or “no” answer may be chosen. Understanding your current process can help identify priority areas to test new interventions.

Some key questions to consider when creating your process map are:

- What does the current state of your process look like?
- How are families and caregivers currently involved in the process?
- At what point in the process does planning for transition home begin?
- Where are the most common barriers to discharge?

Below is an example of a process map from Cincinnati Children’s Hospital for NICU care and babies identified as requiring a tracheostomy. Dark blue process steps and call outs indicate components resulting from OPQC NICU Grads Work. To view larger, click here.
Mapping the process from the perspective of various stakeholders, such as parents, patients or insurers, can be helpful in identifying areas for improvement and coming to consensus on where barriers exist in the system.

**Below is an example of a process map from Molina Healthcare demonstrating the Managed Care Plan perspective for collaborating with NICU teams on transition home.**

**NICU Graduates Population**
Identifying your target population, the action or activity you expect to change, and how you will measure this change are important steps in setting your project aim. In this project, the initial focus was on NICU infants with specific medical interventions including tracheostomy, ventilator, and/or gastrostomy tubes. However, many of the tools and strategies developed in this work can be applied to various neonatal populations.
Family Engagement and Collaboration

Engaging parents and families as valued team members is critical to the change process. Both current and graduate parents provide unique perspectives and offer opportunities for your team to incorporate changes and improvements.

**Family Liaison:** Ideally, this role is filled by a paid parent on staff, who acts as the liaison between the hospital team and the graduate family representative(s), as well as current families on the unit. Professionally, this person may also be a social worker, patient advocate, patient experience professional or educator.

- The Family Liaison connects with the graduate family representative(s) on a monthly basis as their main point of contact.
- Provides guidance to the family representative(s), outlining the structure of the team and the purpose of the project goals.

**Graduate Family Representative(s):** This person is a graduate NICU/PICU parent who has experienced the transition to home process with a medically complex child, within the last 2 to 5 years. Ideally, there should be a two year period after the initial hospital discharge before they are invited to participate for this volunteer position to allow ample time for reflection on his/her experience.

- Ideally, there should be several graduate family representatives for a more diverse, broader view of experiences. Endeavor to create racial, cultural, socio-economical, and geographical diversity on your team.
- The graduate family representatives should be invited to attend monthly meetings, either in-person, via conference call or via a Facetime/Skype or other web-based opportunity. When setting team meeting times, consider alternating between day time and evening meeting times, if that would encourage the graduate family representatives to attend more often.
- If attending monthly meetings in-person, graduate family representatives should be provided a free parking voucher and a cafeteria meal voucher as a way of compensating this unpaid position.
- The graduate family representatives are considered experts and viewed as a valued team member; and asked for their recommendations and ideas frequently. Their role is to contribute to the development of educational tools, products and processes, rather than just be used as the final review after a tool, product, or process has been created.

“I was able to have everything ready and stable when he came home. He was very tiny, almost lifeless. I wanted him to be able to relax and be a normal child at home. I was able to use the [red flag action] plan so it wasn’t as scary. [The NICU team] was able to set everything up in the plan. The action plan was my lifesaver. I was able to go to it if I needed to.

– Lisa, Mother to NICU Graduate
Current Families: Many current families are willing and excited to help provide real-time feedback on educational tools, products or processes. While they are still in the hospital, you have the unique opportunity to ask parents about the efficacy of discharge education, journey boards, red flag action plans and other transition to home tools.

Family Engagement Specialist: During the OPQC NICU Graduates Project, a Family Engagement Specialist was hired as part of the OPQC Team. Below are some of the role responsibilities of the Family Engagement Specialist:

- Attend weekly OPQC team huddle calls and provide the parent’s voice and perspective (1 hour per week)
- Attend monthly OPQC Action Period calls and provide the parent’s voice and perspective (1 hour per month)
- Attend two Learning Sessions per year, Spring and Fall (2 days per year)
- Assist in developing a plan for parent participation during every Learning Session and coordinate their involvement
- Act as the staff connection between the OPQC Faculty and the Family Liaisons from each hospital team
- Either through group calls or one-on-one phone calls, connect with the graduate family representatives from each hospital team on a regular basis, as educational tools, products and processes are being developed
- Provide samples of educational tools, products and processes to graduate family representatives from each hospital via email and invite feedback, comments and suggestions
- Conduct family interviews for the purpose of acquiring quotations, stories, and experiences, in order to gain better understanding and knowledge of the families’ experiences.

Collaboration with Medicaid and Managed Care Plans

One of the most beneficial aspects of this project was the opportunity for NICU teams, Medicaid and Managed Care Plans to collaborate together with families to improve the transition home and experience post-discharge. Managed Care Plan Care Managers were involved early on in design of tools and testing interventions, participating as engaged stakeholders who attended Action Period calls and in-person Learning Sessions. This collaboration was facilitated by Medicaid Bureau Chief for Clinical Operations, Kim DeDino, MS, RD, CSP, as a direct liaison between NICU teams and Care Managers. A special NICU Grads e-mail address at Medicaid was created specifically for concerns related to discharge barriers. This communication tool will remain available after the project ends.

“Partnering with the NICU teams on the NICU Grads projects has improved collaboration between the NICU and MCP care managers. Some NICUs now reach out for assistance on coordination of care for discharge and invite Molina to attend their Care Conferences. They provide collaboration when the Care managers contact the NICU.”

– Marcia, Molina Care Manager
Change Strategies / Project Interventions

A change concept is a general notion or approach to change found to be useful in developing specific ideas that lead to improvement. These interventions were tested by NICU teams and parents and refined based on key learnings.

KEY DRIVER #1: EARLY IDENTIFICATION OF NEED FOR MEDICAL INTERVENTION

CHANGE STRATEGY:
Identify, develop and implement standards to optimize decision to trach, including family readiness and infant’s medical readiness.

Although there is no national consensus (AAP, ATS) on standards to optimize decision to trach, hospitals in this project were asked to look at their individual policies and practices to come to an agreement locally on this important topic. This standard should include not just making a medical decision, but also having a process in place to ensure clinical teams are talking with families about interventions and have the right people involved in the discussion early on. An assessment of current practice, including collecting data on how long this part of the process takes, may reveal some systems that need to change to decide on a tracheostomy in a reasonable amount of time. The ultimate goal should be for each hospital to have a consistent plan regardless of which clinical provider is involved.

Many teams choose to utilize shared decision making tools to support the conversation between health care providers and family members when determining the most appropriate time for the next level of medical intervention in the NICU. Shared decision making tools such as decision aids can often lead to better understanding of complex processes and help families make more informed, confident decisions regarding care.
Improving Transition from NICU to Home for Infants Requiring Complex Care

Change Strategies / Project Interventions

KEY DRIVER #2: STRENGTHENED FAMILY CAPACITY TO CARE FOR INFANT DURING TRANSITION TO HOME AND LONG TERM

CHANGE STRATEGY:
Caregiver education during hospitalization, including:
• Early, repeated education based on learning style assessment
• Use of simulation technology, teach-back method, journey board
• Provision of red flag action plan

Strengthening family capacity for care was a critical key driver in the NICU Graduates project. By educating families to be caregivers earlier in the hospitalization, babies can potentially go home sooner (parent/family education was a frequent barrier to discharge as reported by the OPQC NICU Grads teams). In our population, some key strategies which may be associated with reduction in readmissions included conducting a caregiver learning style assessment to tailor education, having a 24 hour rooming-in period for caregivers prior to discharge, and utilizing a journey board with families. In addition, our findings indicate that developing a red flag action plan throughout the transition to home process may reduce Emergency Department visits (learning style assessment may also impact ED visits). Some examples of these tools, in addition to other valuable change strategies are included below.

Journey Board
A journey board is a tool designed to help families understand the steps in the process during their NICU stay and transition to home. Journey boards often provide valuable prompts for health care providers and families to discuss important topics regarding care for a NICU baby. Journey boards should be able to communicate the pathway to discharge in family-friendly language and include milestones that can be referenced by families and clinicians throughout the hospital stay.

Example: Journey Boards

To view larger, click on the image.
Red Flag Action Plan

Another tool to prepare for care transition to home is the red flag action plan. This is a written plan for acting on clinical “red flags” once the baby is transitioned home. Due to the unique concerns for babies with respiratory conditions, our project teams created a separate Red Flag Action Plan for Tracheostomy, and G-Tubes.

Example: G-Tube and Tracheostomy Tube Red Flag Action Plans

Additional Red Flag Action Plan examples from Rainbow Babies and Children’s Hospital may be found here: G-tube and Trach
Improving Transition from NICU to Home for Infants Requiring Complex Care

24-Hour Rooming-In

A 24-hour rooming-in period prior to discharge is critical in helping parents feel competent and confident to safely care for an infant with a tracheostomy at home. This opportunity can also aid in caregiver development of critical thinking skills to handle emergency situations at home.

Example: 24-Hour Rooming-In Guidelines

To view larger, click on the image.

CHANGE STRATEGY:
Assessment of family’s emotional needs

- Engage social work team to screen for various behavioral/mental health issues
- Use conversation starters, like “Tell me how you are doing” “Do you mind if I sit and talk with you for a while” “What’s going on in your world today” “Some families have told me that this is very stressful. What are you doing to help cope through all of this?”

CHANGE STRATEGY:
Develop and activate peer social support and parent community

- Hire a graduate parent as a staff person to help inform team of the parent and family perspective, and to act as the family-staff liaison
- Develop and nurture a cadre of graduate parent volunteers to support families in the hospital
- Create and monitor a closed-group social media presence (Facebook) for families to connect and exchange ideas, once they transition to home

CHANGE STRATEGY:
Continuous support from sub-specialty team after transition to home, including having a plan to utilize technology such as e-mail and telemedicine to connect families & providers after transition to home.

- Utilize technology (email, teledmedicine, app, text capabilities) to connect families and providers after transition to home
Improving Transition from NICU to Home for Infants Requiring Complex Care

Change Strategies / Project Interventions

**KEY DRIVER #3: EARLIEST AND STANDARDIZED PROCESS FOR TRANSITION TO HOME**

*Example: Transition Bundle*

The NICU Grads transition bundle of 9 key tools/strategies may aid in an effective transition from NICU to home. Examples of many of these tools may be found throughout this change package.

<table>
<thead>
<tr>
<th>Transition Plan Bundle Elements (Discharge Preparation Activities)</th>
<th>Suggested Resources</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Assign Discharge Coordinator</td>
<td>Trained and dedicated personnel</td>
</tr>
<tr>
<td>2. Create and discuss journey board for transition planning once determining medical intervention/procedure is to occur</td>
<td>Journey Board</td>
</tr>
<tr>
<td>3. Arrange for appropriate DME (assuring caregiver is competent in use), home nursing, and additional resources as needed</td>
<td>Trained and dedicated personnel</td>
</tr>
<tr>
<td>4. Provide red flag action plan for post-discharge care that is culturally and language appropriate and share with PCP and home nursing</td>
<td>Red Flag Action Plan, Home Nursing Plan, Home Vent Card</td>
</tr>
<tr>
<td>5. Provide a tool for caregivers and providers to reference available public resources relevant to this specific patient</td>
<td>Community Resource guide</td>
</tr>
<tr>
<td>6. Begin caregiver education within 7 days of medical intervention and complete training in infant CPR and relevant medical care for the patient before discharge</td>
<td>Education packet, Use “Teach Back” methodology</td>
</tr>
<tr>

<td>Rooming In Checklist, Use &quot;Teach Back&quot; methodology</td>
</tr>
<tr>
<td>8. Schedule follow up appointments convenient to family with relevant medical care for this patient</td>
<td>Trained and dedicated personnel</td>
</tr>
<tr>
<td>9. Schedule conference call with all pre and post discharge caregivers e.g. current provider (pulmonologist/neonatologist), caregiver(s)/parent(s), and future provider (PCP)</td>
<td>Conference call agenda and script</td>
</tr>
</tbody>
</table>
Improving Transition from NICU to Home for Infants Requiring Complex Care

Change Strategies / Project Interventions

CHANGE STRATEGY:
Enhanced understanding of public resources, including tools to guide appropriate resource utilization (DME, home nursing, community support, etc.)

In our population, patients who had a reference tool of available public resources reviewed prior to discharge were found to have reduced readmissions. This Community Resource Guide template was developed as a foundation for teams to populate with local information and adapt categories to their individual patient needs. The document may be provided as handouts to families, or utilized and updated through an online platform.

Example: Community Resource Guide

KEY DRIVER #4: ENHANCED COORDINATION OF CARE THROUGH A PREPARED MEDICAL HOME AND NEEDED COMMUNITY RESOURCES

CHANGE STRATEGY:

Standardize hand off between Children’s Hospital and PCP, with standard communication including:

- Phone call prior to transition home with entire team including current provider (pulmonologist/neonatologist), family caregivers/parents, and PCP
- Discharge notes and red flag action plan provided to PCP in timely manner

Example: **Discharge Care Conference Script** (Cincinnati Children’s Hospital)

---

**Discharge Care Conference Script**

**Goal**

To arrange a meeting one to two weeks before discharge with inpatient and outpatient disciplines and caregivers.

Communication during the meeting to assure caregivers are aware of their outpatient resources and determine what still needs to be completed prior to discharge.

**APN and/or care manager to have an updated AVS and or discharge summary to go over at discharge meeting.**

**To be invited:**

**Inpatient Pulmonary Team:**
- Pulm APN
- Pulm attending/fellow
- Social work
- Care manager
- Caregiver educator(s)
- Primary nurses

**Outpatient Pulmonary Team:**
- Pulm attending
- Pulm RN
- Social worker

**Outpatient Resources:**
- DME representative
- Private Duty Nursing representative
- Managed Care Plan case manager (as applicable)
- Primary Care Physician or Complex Care MD (as applicable)
- Home Choice representative (OH only-as applicable)
- Complex Care Doctors: Dr. XX, Dr. YY
- Pulmonary Nurses: Nurse XX, Nurse YY

**Contact:**
- Jane Doe (team lead) – e-mail, phone

---

**What will be covered:**

**Outpatient Resources:**
- Equipment delivery and education
- When PDN starting
- Who to contact with questions about PDN or DME
- Home Choice contact information
- MCP contact information and when to contact
- When to make first PCP appointment and when to contact with questions

**Outpatient Pulmonary Team:**
- Recommended outpatient follow up
- Outpatient resources available
- Who to contact with needs?

**Inpatient Pulmonary Team:**
- Medical updates
- Financial resource updates
- Equipment and nursing orders completed
- Follow appointments needed
- Therapy updates and outpatient recommendations
- Any education that still needs to be completed
- Home feeding plan/WIC appt/formula

---

**To view larger, click on the image.**
KEY DRIVER #5: AVAILABLE AND ADEQUATELY TRAINED HOME NURSING WORKFORCE

Many of the change strategies in this key driver reflect a remaining need for continued work around increasing and supporting a trained home nursing workforce to meet the needs of NICU Graduates with technology dependence and other pediatric complex care patients. One strategy currently being tested by Cincinnati Children’s Hospital is to partner directly with a healthcare staffing/home healthcare agency to provide in-hospital training for Private Duty Nursing (PDN) staff. The expectation is that this training model will result in more confident PDN staff and families, and a smoother transition to home for NICU babies.

CHANGE STRATEGY:
Identify eligibility for available resources (Managed Care Medicaid/payer, Waiver) and early triggers for application process

CHANGE STRATEGY:
Work with Medicaid/payer to ensure qualified home nursing, including to develop guidelines for home nursing care with individualized patient red flags

CHANGE STRATEGY:
Create and standardize assessment/reassessment tools to match home nursing services to the child’s needs

Assessment tools for this population should include non-medical needs, as these needs contribute to complexity both for the family and for the entity involved in provision of Home Nursing services. Suggested assessment domains for non-medical needs are included in later discussion in this change package.
CHANGE STRATEGY:
**Ensure seamless provision of Durable Medical Equipment and other emergency equipment, including:**
- Standardize checklists for DME with best practices
- Establish early contact with DME providers

Example: **Checklists for Discharge Process** (Nationwide Children’s Hospital)

An additional Checklist for Discharge from Cincinnati Children’s Hospital may be found here: [Discharge Checklist](#)
Improving Transition from NICU to Home for Infants Requiring Complex Care

Change Strategies / Project Interventions

KEY DRIVER #6: COLLABORATION AMONG FAMILIES, CLINICIANS, HOSPITALS AND INSURERS TO IDENTIFY & ADDRESS SYSTEM BARRIERS

CHANGE STRATEGY:
Identify and communicate with Medicaid/payer Care Manager/Case Manager
Throughout the NICU Grads project, key strategies were tested to incorporate Managed Care Plans (MCPs) earlier in the discharge process and build a stronger relationship between payers, families/caregivers and NICU teams. These included identifying one contact at the MCP to liaison with the NICU team, educating parents/caregivers about the benefits of care management, and inviting MCPs to participate in the discharge care conference.

Example: Home Going Discharge Instructions (Akron Children’s Hospital)

To view larger, click on the image.

CHANGE STRATEGY:
Standardize roles and responsibilities of discharge point person at Children’s hospital and Medicaid/payer, and include family in communication
Key measures were identified at the start of this project to help guide the work and focus on important areas for improvement. Both process and outcome measures were utilized, as well as a variety of sub-outcomes that were important to our particular collaborative. One consideration for measurement was an interest in differentiating between which key drivers teams may be able to impact at an individual hospital level, and which may need to be addressed through policy change at a system level. In addition to data collection for individual patients, teams completed a baseline and subsequent annual systems inventory survey to indicate their current practice for elements of the transition bundle (See page 17).

Below are a list of suggested elements for data collection. In general, institutions should tailor measurement strategies to address individual goals and specific areas for improvement:

1. Discharge date
2. Does this baby have a Tracheostomy at discharge?
   • If Yes, when was the initial consult for the tracheostomy ordered?
   • If Yes, provide the procedure date
   • If Yes, was the baby ventilator dependent at discharge?
3. Does this baby have a Gastrostomy Tube at discharge?
   • If Yes, when was the initial surgery consult ordered?
   • If Yes, provide the procedure date
4. Indicate date baby is determined to be physiologically ready for discharge
5. Date a journey board was started for this baby’s discharge plan
6. Indicate date the Managed Care Plan was notified the baby was in your hospital (if applicable)
7. Date DME (durable medical equipment) provider was initially contacted
8. Caregiver(s) were given a formal learning style assessment (using an assessment tool)?
9. Date caregiver(s) post discharge medical care training was initiated
10. Date caregiver(s) post discharge medical care training was completed
11. Red Flag Action Plan was reviewed before discharge with caregiver(s)
12. Was a Discharge Coordinator identified prior to discharge?
13. Date home nurse was identified and assigned to baby (if applicable)
14. Caregiver(s) reviewed a reference tool of available public resources relevant to the care of this patient prior to discharge
15. Caregiver(s) had the opportunity to ‘room-in’ with the baby for at least 24 hours simulating their home environment
16. Caregiver(s) had a call with the discharge provider and primary care provider and/or post discharge provider where patient status and discharge plan was communicated
17. What is the caregiver(s) biggest worry about caring for the child at home?
If your team wishes to use the data collection elements listed above to replicate the outcome measures used by OPQC, please consider the following recommendations:

- **Average time from date of medical intervention to care at home** – This is defined as the date of discharge minus the procedure date. If the patient has both a Gastronomy Tube and a Tracheostomy, use the date of the first procedure date to calculate the result.

- **Readmissions within 7 days or between 7 and 30 days** – These measures only count the first readmission within 7 days or between 7 and 30 days for each patient to ensure these measures are done on a patient level rather than a readmission level.
Background

Both the population of, and hospitalizations for children with complex conditions are on the rise in US hospitals with attendant costs estimated to be $50-110 billion annually. In 2008, the American Academy of Pediatrics updated their Hospital Discharge guidelines for high-risk neonates, emphasizing the needs for well-coordinated care, individualized planning and physician judgement. In addition to the varied and intensive medical needs of these children, there are significant non-medical, social and psychological needs for these children and their families to be evaluated in the course of establishing a sufficient and appropriate care plan, adjusting it as medical and non-medical needs evolve.

The initial focus of the NICU Graduates work was on the unique needs of infants and children that are discharged with Chronic Lung Disease of Prematurity and technology-dependence (e.g. tracheostomy, ventilator, and/or enteral feeding tubes), during the first three years of their lives. Central to our vision is the conviction that care in the child’s home, with their family, is optimal, when the family has the resources to successfully care for the child at home. Following their hospital discharge, many families deliver care similar to hospital level in their own homes. Additional work is needed to address the larger population of children with medical complexity (CMC), who have multiple chronic conditions, high healthcare utilization and often technological dependence. AAP Discharge Guidelines could be adapted for the heterogeneous conditions in CMC, including neurologic/neuromuscular conditions, congenital anomalies, cardiac disease, genetic/metabolic conditions, malignancies and transplants. Their ongoing support needs involve a lifespan trajectory and must support a broad array of activities of daily living.

From late 2016 through May 2017, Drs. Jennifer Lail, Garey Noritz and Dan Benscoter, and other subject matter experts from inpatient, outpatient, home health, ODM, and Medicaid Managed Care collaborated to determine the parameters and key factors for inclusion in tools to evaluate the changing medical and non-medical needs of these children with medical complexity. The aim for the tools was to ensure that the right levels of care are assigned and delivered to the child, at the right time and in the optimal setting.

---

The changing healthcare environment necessitates the standardization and coordination of care to support families in anticipating and adapting to their needs following discharge from an acute-care facility. In addition to managing high medical needs, services, therapies and equipment for survival, families require adjustment over time to their child’s fluctuating health acuity. Families need empowerment, training, and support to have the capacity to respond to other medical and non-medical family needs, such as another illness in the family, a new sibling, or a family crisis. The cumulative costs, family stress, and potential work loss with a young child or youth with protracted illness must be considered in evaluating methods of support, including access to medical equipment, home nursing, and other therapies. Many of these topics are discussed in more detail in a supplement to Pediatrics entitled “Building Systems that Work for Children with Complex Health Care Needs.”

Objectives
- Develop, as an example, guidelines for the post-discharge and home care needs for children leaving the neonatal intensive care unit with technology dependence (birth – 30 months)
- Identify and anticipate the needs of children with technology dependence (birth – 30 months), including home nursing needs, needs for durable medical equipment, and other healthcare needs, categorizing these according to the various professional roles (home nurse, care manager, primary and specialty providers, DME suppliers).
- Identify potential methods for more systemically capturing a family’s “non-medical needs,” with particular attention paid to how those needs affect caregiver capability or capacity to care for a child at home

Challenges and Considerations
To meet and adapt to the changing needs of children and families with tracheostomies, ventilators, enteral feeding tubes, and central vascular access outside of the hospital setting, a network of collaboration (“the Medical Neighborhood”) between families, insurers, primary care providers, pediatric specialists, home

---

Notes:
11 Coordinating Care in the Medical Neighborhood: Critical Components and Available Mechanisms. US Dept of Health and Human Services; AHRQ Publication No. 11-0064, June 2011
Improving Transition from NICU to Home for Infants Requiring Complex Care

Thinking About Care in the First Few Years after Discharge

Inherent in the life of an infant with technological dependence is the increased risk imposed by intercurrent illness, however minor, which may acutely escalate the child’s care and surveillance needs. The needs of the child’s family care providers may also increase with job loss, family conflict, sibling instability, or funding stress. Accordingly, our system demands flexibility to increase services and support urgently in such events, hopefully avoiding deterioration or hospital re-admission. Equally important is regular assessment for opportunities to decrease support services or remove equipment as the child’s clinical trajectory improves and clinical severity decreases.

The goal is safe transition of and ongoing care for all neonates, but specifically NICU graduates who are technologically dependent. Collaboration and advocacy across the state for systems and policies that optimally support our children requires input from each phase and site of their complex care journey. The presence of clinical “stability” is not necessarily an indicator that resources are no longer needed and can be removed; lack of hospitalization or ED utilization can indicate the family is self-managing only because of the critical supports of home nursing, respite care, equipment and supplies, and funding in place. Building a “medical neighborhood” that allies health care resources with those of schools, faith-based groups, non-profits, non-licensed support personnel, social and mental health services, housing authorities and legal aid will be essential to support our growing population of children with both complex and chronic conditions in the least restrictive and most fiscally viable environment.

Assessing Medical and Non-Medical Needs
Several nascent tools were developed intending to inform the care and identify the medical and non-medical needs for children with medical complexity. We believe that these materials would be useful elements for medical education for families of children with medical complexity, residents, and other healthcare professionals responsible for addressing the many and varied needs for these children and their families.

Evaluation of Non-Medical Needs for Children with Medical Complexity – A Modified Self-Sufficiency Matrix

Administration
The Self Sufficiency Matrix is an assessment and outcome measurement tool that may be used to better understand how a client is doing and whether an intervention is appropriate for this client and family. Indicators on this tool show what information should be collected, but not how to collect it. The questions in red may help to guide your conversation, address difficult issues, and determine which indicators are being met. Information needed for this assessment should come from:

- The client/family – use this tool as a topic list during conversation and enter scores afterward or during interview.
- Colleagues, community supports, and clinicians who know the patient and family – use information from interactions that others may have had with the client. This supplementary information may help fill in the gaps and be relevant to the assessment.
- Administrative records – client medical record notes or discharge summaries can be informative, as well as other administrative records available.

Building Trust
Beginning the assessment as a conversation with open-ended questions may help build rapport to develop a trusted relationship and discuss these sensitive topics. For example, rather than asking if a client’s housing is stable, you may ask “Tell me about your home. Is there something about your home situation that would help us know how we can help you more?”

Scoring
Scoring should start with the highest level of sufficiency, and you should decide whether a client meets indicators in the first cell “empowered” – if not, work backwards until you reach the level of self-sufficiency appropriate for each client. Consider whether a client would meet the majority of the criteria in a cell when making assessment. The levels within the domains are mutually exclusive, and only one may be selected. All scores must be entered as ordinal, whole numbers (there are no half-scores).

Improving Transition from NICU to Home for Infants Requiring Complex Care

Thinking About Care in the First Few Years after Discharge

**Addressing Changes over Time**
For the pediatric population with technological dependence, current assessment of ongoing nursing and home care needs would benefit from unified and standardized tools and policies, with particular focus on the unique needs of children whose families are delivering care similar to hospital level in their own homes. Processes for reassessment frequency, remediation of identified care gaps and re-evaluation of social determinant risk factors should be applied in a reliable fashion to support appropriate care.

**Matching Needs with Resources after Discharge**

### Children with Medical Complexity - Non-Medical Needs Assessment Tool Process

- **Provider/Stakeholder Communication**
  - Bi-directional communication of assessment results amongst stakeholders regarding patient needs

- **Re-Evaluation for CMC**
  - Periodic reassessment based on qualifying life event
  - Qualifying Life Event (Life change, JFS Referral, hospitalization)

- **Initial Evaluation - First Discharge**
  - First discharge to home

- **Medical + Non-Medical Needs Evaluation**
  - PDN Assessment completed
  - Nursing Hours Granted?
    - Are hours sufficient for current needs?
      - YES: Complete whole Non-Medical Needs Assessment
      - NO: Re-evaluation of nursing hours and/or other services received

- **Low Needs**
  - Health Related Social Needs Assessment
  - Use Wheel of Life to Triage Domains of Non-Medical Needs Tool
  - Based on wheel of life, complete relevant sections of NMN assessment
  - Use results to inform/identify other support needs

- **High Needs**
  - Use results to identify and prioritize most critical needs
  - Re-evaluation of nursing hours and/or other services received

10/19/17
Improving Transition from NICU to Home for Infants Requiring Complex Care

Thinking About Care in the First Few Years after Discharge

Beyond Medical Needs – Activities of Daily Living

In order to provide an evidence-informed consensus summary of how to assess ongoing needs of children with special health care needs outside of the hospital setting, we applied an initial focus on infants and children who have Chronic Lung Disease of Prematurity and technology-dependence (e.g. tracheostomy, ventilator, and/or enteral feeding tubes). Guidelines, along the child’s clinical timeline were developed based on expert clinical consensus with input from Neonatologists, Complex Care pediatricians, nurses, respiratory therapists and staff who assist with Durable Medical Equipment and supply provision. Additional work would be needed to address the larger population of children with medical complexity (CMC), who have multiple chronic conditions, high healthcare utilization and often technological dependence. Such guidelines would need adaptation for the heterogeneous conditions in CMC, including neurologic/neuromuscular conditions, congenital anomalies, cardiac disease, genetic/metabolic conditions, malignancies and transplants. Their ongoing support needs may span a longer trajectory and must support a broad array of activities of daily living.

Guidelines for Post-Discharge and Home Care of NICU Graduates with Technology Dependence
